WEAR-CHECK INDICATOR

Want to inspect the rubber hose in your slurry process, but!

- Hose in an awkward location for easy inspection
- Sick of crawling into hose to check the wear?
- Don't want to stop the process to inspect?
- Hazardous slurry?
- Want to know about the wear situation while still running?
- Need a better way to determine predictive wear?

Another breakthrough from Townley!

At last, integrated sensors located at strategic wear tube depths allow for in-situ monitoring of wear without disconnecting hose. A simple ohm meter probe or continuity test will alert you to wear progress through the tube. This notification will give you sufficient time to schedule hose rotation or order a replacement.

Custom depths as you want it, set at 1/2" or 1/4" intervals so you can monitor during normal P/M checks of the line.

Color coded for identifying wear depth!

Plug style output or junction box.
